

DEC 30 1996

SUMMARY

The Injecto Flush was designed to give a more practical and consistent way of flushing out reusable biopsy forceps and cannulated instruments.

The Injecto Flush was also designed to have no effect on the break down of instrumentation nor any possibility of cross contamination. The Injecto Flush is a one time disposable, but totally recyclable flushing unit.

In this day and age when cost containment plays a big factor in the medical profession, the Injecto Flush also offers the opportunity for institutions and health facilities to do away with one time expensive disposable instruments and revert to a reusable instrument but, inexpensive flushing device with no additional risks of any kind.
